# Workforce Skill Development

Problem

In a modern production environment, workers are responsible for greater scope of control and monetary in-process product value than ever before. Skills development for the manufacturing process includes training and education of workers, engineers, and technicians to improve their technical, operational, and problem-solving skills.

Solution

An offline training system can be used to create situations and operational challenges that an operator could encounter in the actual manufacturing environment. The operator's abilities to resolve safety, environmental, production, or quality threats can be tested and documented.

noesis

A proven process management solutions partner, providing data insights and connectivity across any level of an organization to maximize business decision making.
